Programmable logic arrays ($18 \times 42 \times 10$)

PLS153/A

DESCRIPTION

The PLS153 and PLS153A are two-level logic elements, consisting of 42 AND gates and 10 OR gates with fusible link connections for programming I/O polarity and direction.

All AND gates are linked to 8 inputs (I) and 10 bidirectional I/O lines (B). These yield variable I/O gate configurations via 10 direction control gates (D), ranging from 18 inputs to 10 outputs.

On-chip T/C buffers couple either True (I, B) or Complement ($\overline{I}$, $\overline{B}$) input polarities to all AND gates, whose outputs can be optionally linked to all OR gates. Their output polarity, in turn, is individually programmable through a set of EX-OR gates for implementing AND/OR or AND/NOR logic functions.

The PLS153 and PLS153A are field-programmable, enabling the user to quickly generate custom patterns using standard programming equipment.

LOGIC FUNCTION

TYPICAL PRODUCT TERM:

$Pn = A \cdot B \cdot C \cdot D \cdot \ldots$

TYPICAL LOGIC FUNCTION:

AT OUTPUT POLARITY = H

$Z = P0 + P1 + P2 \ldots$

AT OUTPUT POLARITY = L

$Z = \overline{P0 + P1 + P2 + \ldots}$

$Z = \overline{P0} \cdot \overline{P1} \cdot \overline{P2} \cdot \ldots$

NOTES:
1. For each of the 10 outputs, either function Z (Active-High) or $\overline{Z}$ (Active-Low) is available, but not both. The desired output polarity is programmed via the Ex-OR gates.
2. Z, A, B, C, etc. are user defined connections to fixed inputs (I) and bidirectional pins (B).

LOGIC PROGRAMMING

The PLS153/A is fully supported by industry standard (JEDEC compatible) PLD CAD tools, including Philips Semiconductors SNAP, Data I/O's ABEL™ and Logical Devices, Inc. CUPL™ design software packages.

All packages allow Boolean and state equation entry formats. SNAP, ABEL and CUPL also accept, as input, schematic capture format.

PLS153/A logic designs can also be generated using the program table entry format detailed on the following page. This program table entry format is supported by the Philips Semiconductors SNAP PLD design software package.

To implement the desired logic functions, the state of each logic variable from logic equations (I, B, O, P, etc.) is assigned a symbol. The symbols for TRUE, COMPLEMENT, INACTIVE, PRESET, etc., are defined below.

NOTES:
1. This is the initial unprogrammed state of all links.
2. Any gate P_n will be unconditionally inhibited if both the True and Complement of an input (either I or B) are left intact.

VIRGIN STATE

A factory shipped virgin device contains all fusible links intact, such that:
1. All outputs are at “H” polarity.
2. All P_n terms are disabled.
3. All P_n terms are active on all outputs.

CAUTION: PLS153A TEST COLUMNS

The PLS153A incorporates two columns not shown in the logic block diagram. These columns are used for in-house testing of the device in the unprogrammed state. These columns must be disabled prior to using the PLS153A in your application. If you are using a Philips Semiconductors-approved programmer, the disabling is accomplished during the device programming sequence. If these columns are not disabled, abnormal operation is possible.
Furthermore, because of these test columns, the PLS153A cannot be programmed using the programmer algorithm for the PLS153.
